DUPRO[®]
— The Professional tools

The new **LOCATOR** HSS Twist Drill (Patent Pending), which has a newly developed tip geometry which we call (S-Cut) grinding. The „S“ stands for the shape of the center point. In addition, the center point has **asymmetrical** flute recesses, which creates a maximum cutting effect from the center point.

S-Cut

Flute Recesses

The combination of these geometries means that the drill has a very precise and clean centering effect (**Pic1**) compared to conventional HSS drills bits (**Pic2**), even if the position to be drilled is not grained or pre-drilled, regardless of the material. Even in materials such as composites, duroplastics and also in WPC are no problem. The centering property also means that the accuracy of the hole is far more precise.
